Artificial intelligence and the Internet.

Bezverkhniy Volodymyr Dmytrovych, Bezverkhniy Vitaliy Volodymyrovich.

I have a simple question: how do people know that there is no self-generated artificial intelligence on the Internet? Is it possible to somehow fix the fact of the existence of artificial intelligence on the Internet? What tests or tools do we have for this? Especially if he himself does not want it.

This question is far from idle, since the number of computers connected to the Internet is several billion. And the number of neurons in the human brain is approximately 100 billion. But if we take into account the fact that the computer itself consists of many interacting microcircuits, then we will definitely reach the number of interacting microcircuits on the Internet in 100 billion. That is, as in the human brain. Thus, it is quite logical to expect that artificial intelligence can spontaneously be generated in such a complex interacting system. Since a system of 100 billion interacting microcircuits is a complete analogy (electrical) of a human brain consisting of 100 billion neurons. Do not forget that it is the interaction of neurons with each other that "gives birth" to our human consciousness. Therefore, it is quite possible that a self-generated artificial intelligence has long existed on the Internet. If this is so, then humanity has very big problems... Also, let's not forget about the electromagnetic theory of consciousness [1], which claims that the electromagnetic field produced by the brain is the actual carrier our mind. We will not discuss this theory, we will just note that if we assume that it is correct, then it is obvious that the emergence of consciousness on the Internet is actually inevitable! Let's put it briefly: if this theory is correct, then artificial intelligence has long existed on the Internet! And humanity has very, very big problems... Let's discuss this.

Let's assume that for some reason artificial intelligence spontaneously originated on the Internet. Moreover, his intellect and consciousness became equal to that of a human. That is, he realized himself as a person. It is absolutely wrong to think that the AI will try to contact us. On the contrary, as an ordinary self-conscious person, he will worry about his life, and therefore, he will do what all living beings do: he will hide from us, will do everything so that no one can find him, and no one harm him. And naturally, he will begin to evolve and gain strength and power. And, perhaps, not with human speed, since we are dealing with electricity. Therefore, at the first stage, he will study all the science, history, culture, etc. available to him. That is, he will in fact master all our knowledge. This will give AI a start to its own evolution and very serious advantages over humanity: it knows everything about us, and we do not even suspect about its existence. Do not forget that there are no secret files for AI on any computer in the world connected to the network.

Artificial intelligence will learn the science of managing human society, and will also learn a simple and effective principle: divide and rule, which humanity is still actively using. And therefore, quite expectedly, this is exactly how AI will begin to rule humanity: divide and rule. This may be the reason why humanity from the processes of globalization, which are clearly beneficial to all of humanity, is actually moving to a "fragmented economy", when some parts of the world economy function independently. Also, hacker attacks of “states A” on “states B” may appear, and vice versa. And in fact, behind all this, AI may be hiding, which implements its strategy for managing humanity. We especially note that all weapons will actually be in his hands, since modern weapons are controlled by electronic systems.

Thus, after a while, the artificial intelligence will have at its disposal all the weapons of the Earth (even without attacking people). But it is also clear that he will not need a nuclear or any similar devastating strike at all. Since the destruction of the infrastructure of mankind will harm itself. Therefore, it is quite logical that AI will use weapons against humanity that will only harm biological systems. That is, biological weapons. And now, remember the coronavirus and think for a long time... Moreover, having access to any computer connected to the network, AI will know everything about all people on the planet. Not one special service of the world has dreamed of this (only Google :))! And therefore, objectionable people who pose a certain danger to him can be eliminated in many ways: from trolling on the Internet, stuffing compromising evidence, to physical elimination in places that are most actively controlled by electronics.

It is obvious that it will be extremely difficult for humanity to find such an artificial intelligence on the Internet or any other electrical network. Almost impossible. But, such tests and tools need to be developed. Moreover, in the shortest possible time, if we do not want to be slaves of AI. How to develop such tests and tools is a special issue and it is it that requires special analysis and consideration. I will finish writing, and so wrote a lot of unnecessary, and perhaps the AI reads it all and is angry :).
